

Biodiversity

Biodiversity is in rapid decline throughout the U.S. and North America.

- Over the last 50 years, [wildlife populations have declined](#) by an average of 20% in North America.¹
- There are [3 billion fewer birds](#) in North America than there were in 1970 (a 30% decline); birds are on track to decline by another 50% by 2070.²
- 500 animal species and 768 plant species are listed as [endangered](#) in the U.S.; and
- 231 animal species and 171 plant species are listed as threatened.³

That's over a thousand species, some of which have inhabited the earth for millions of years, facing the threat of being extinguished — in our country and under our watch.

More People, Fewer Birds

Another way to assess the decline: a rough estimate of how many birds there were for every person in Canada and the United States in 1970 and in 2018.

Habitat loss is the single greatest threat to biodiversity and ecosystems, even more than climate change.⁴

- The United States loses roughly a football field of nature **every 30 seconds** (about 1.5 million acres every year).⁵
- "[H]abitat fragmentation is now so severe that a pin dropped at random on a map of the contiguous United States can be expected to land less than half a mile from human development." - [Center For American Progress](#)

Population growth is the main driver of habitat loss⁶ in the U.S. and globally.⁷

- Population growth is a primary driver of habitat loss.⁸

⁸ WWF (n 4)

- [60% of sprawl](#) in the U.S. (1982-2017) has been a result of population growth. States with rapidly growing populations have higher rates of loss than states with slowly growing populations.⁹
- High population areas experience increased numbers of [invasive plant and fish species](#)¹⁰
- Local extinction rates of large mammals [inside national parks](#) increases along with population density outside park boundaries.¹¹ [Housing growth](#)¹² is the main threat to [protected areas](#).¹³
- Immigration is the [primary driver](#) of population growth in the United States¹⁴, the third-most populous country on Earth behind India and China.

There are many factors that contribute to loss of habitat and biodiversity, and many ways to **mitigate** the losses without addressing immigration policy. Given immigration's outsized role in U.S. population growth, however, there is no way to **prevent** habitat and biodiversity loss without addressing federal immigration policy.

Every nation has a right and a responsibility to the international community to conserve nature within its own boundaries. Immigration policy should reflect that responsibility.

The United States is still one of the [most biodiverse](#) nations in the world.¹⁵ Of the remaining intact global areas [identified](#) as necessary to reverse further biodiversity loss and enhance natural carbon removal¹⁶, 75% are within just [six countries](#), including the United States¹⁷.

"Within the biomes and landscapes threatened by sprawl are found some of our most critical natural habitats. According to the World Wildlife Fund, habitat loss poses the single greatest threat to endangered species around the world. The United States is home to approximately 1,660 species and subspecies of plants and animals formally listed as federally endangered or threatened by the federal government (specifically, by the U.S. Fish and Wildlife Service and the National Marine Fisheries Service). Most of these are seriously harmed by ever-expanding sprawl and ever-encroaching development of one form or another that modifies, degrades, or eliminates the habitats they need to survive." - [From Sea to Sprawling Sea](#)
